- Serve as teaching assistant for introduction to computer science class (Java).
- Responsible for marking assignments and answering student questions on the course forum.
- Also responsible for proctoring the midterm.

Volunteer Experience

Paul Menton Centre Carleton University(Note-taker)

Typing up lecture notes and submitting them on the PMC Portal within 48 hours after each class

Applied Projects

Peer-Aide (In-Progress)

Designed using *Node.js Express* framework. This is built to help students check for course details as well as professors offering the course at the moment and times in which the course is being offered and also check related past questions to the course to aid better study. Also it will allow students search for professional tutors for a particular course to assist in any way possible. All info is stored in *MYSQL* database and properly secured as well which includes routes, hashing the passwords before storing it in the database etc. This was also implemented using *RESTful API*.

Ivanhoe Board Game

. Built a java card-based online multiplayer which permits players to play across a network using their computers via a known IP address and port number.

- . Used *Agile* Methodology, *SCRUM* approach and *Model-View-Controller* design pattern.
- . Integrated multithreaded TCP/IP networking protocol.
- . Provides a neat GUI that allows the user to select cards.

Distributed Meeting Scheduler

- . Built a *C++* application for scheduling meetings between multiple users across a network using TCP/IP.
- . Provides a command line UI that allows the user to select dates and potential locations
- . The scheduler uses *libICAL* library to select a date and time for the meeting based on participants pre-existing schedules (Finds the location and time that would be easiest for all users to get to and from based on other meetings on their schedules)
